

Note Prepared by Shri S P Bagaria,
Messrs Rosewood Projects (P) Ltd.

There has been a news in the media that in Delhi roads at different places get collapsed inter-alia due to the trenchless work which is done by Telecommunications and Electricity Service Providers, Gaspipe Service Provider and /or similar other agencies laying underground utilities. Such thinking or arriving at the above conclusion is totally baseless and with wrongful intent. Such matters which are brought to the notice of the public by media have no legs. This is done by the unscrupulous minded person to cause damage to the nation so that the nation does not grow.

Firstly the trenchless work is done at the depth of 4mtrs to 5mtrs. Therefore the collapse of the roads cannot be the reason or cause for the collapse of the roads about 2 feet to 3feet. The main reason is the centuries / decades old underground water pipes and sewerage pipes which are laid or exist at 1mtr approximately have leakages which are the main criteria or reason for collapse of the roads.

At the time of laying of underground utility through trenchless method if any water line or sewerage is damaged the same are immediately taken care of by the service provider and the concerned Government Agencies. Therefore this cannot be the reason or ground for collapse of the roads.

In or around Delhi new carpeting or infrastructure work is being done on the Delhi roads and as a result the work done of laying of OFC cables or electric cables or gas pipes go more deep then the earlier laying.

Not only in several States or parts of India but throughout the world the laying of underground utilities has been and is being done by trenchless technology which is the most expeditious and safest technology otherwise no nation can grow.
